

GUMO K

Continuously protects the substructure and prevents surface friction noises from aluminium substructures.

GUMO K DETAILS

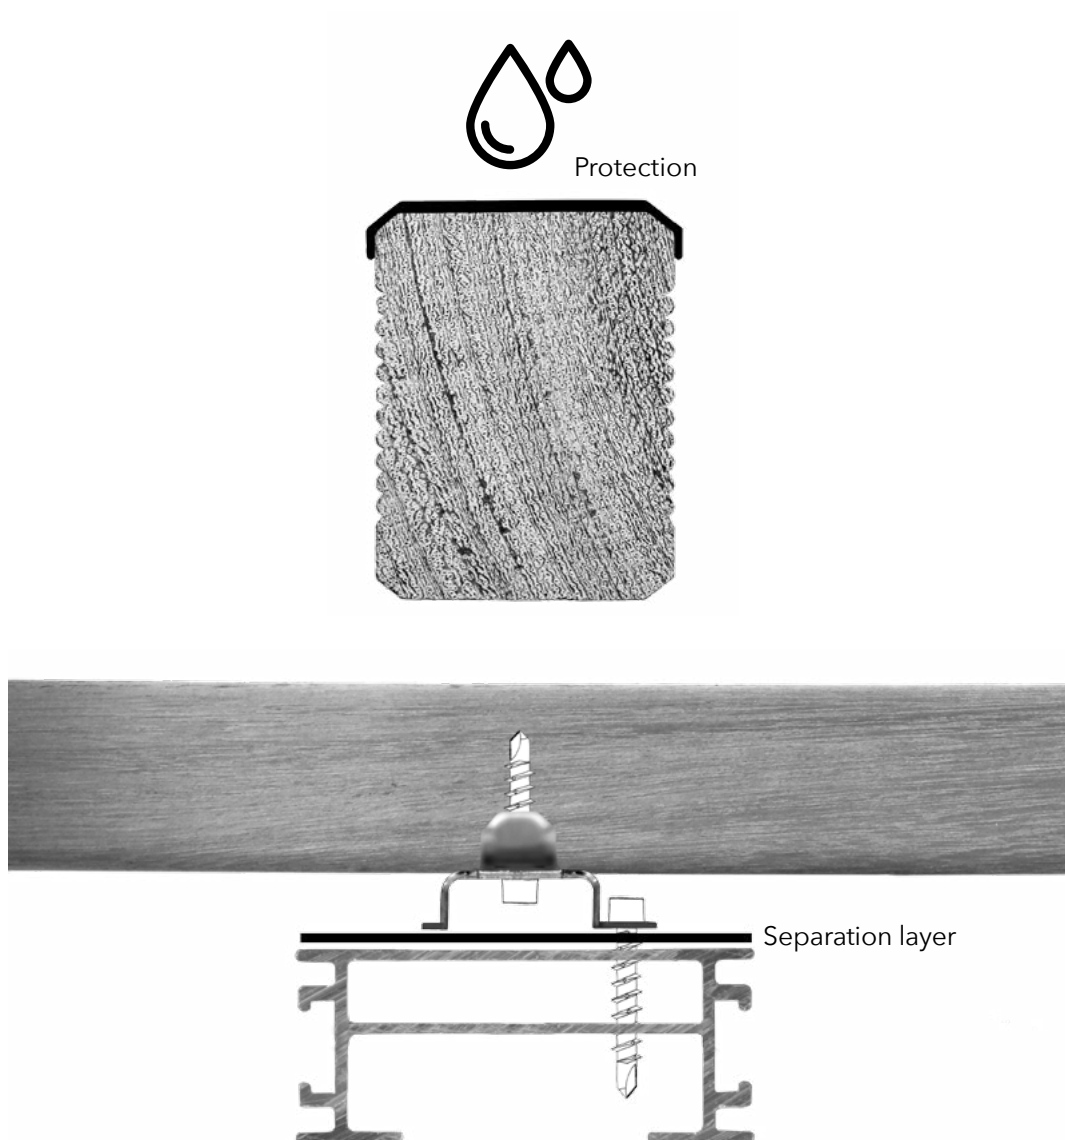

GUMO K is a self-protection and isolating band for substructures made of wood and aluminium.

GUMO K protects the wooden substructure permanently against dirt and water retention.

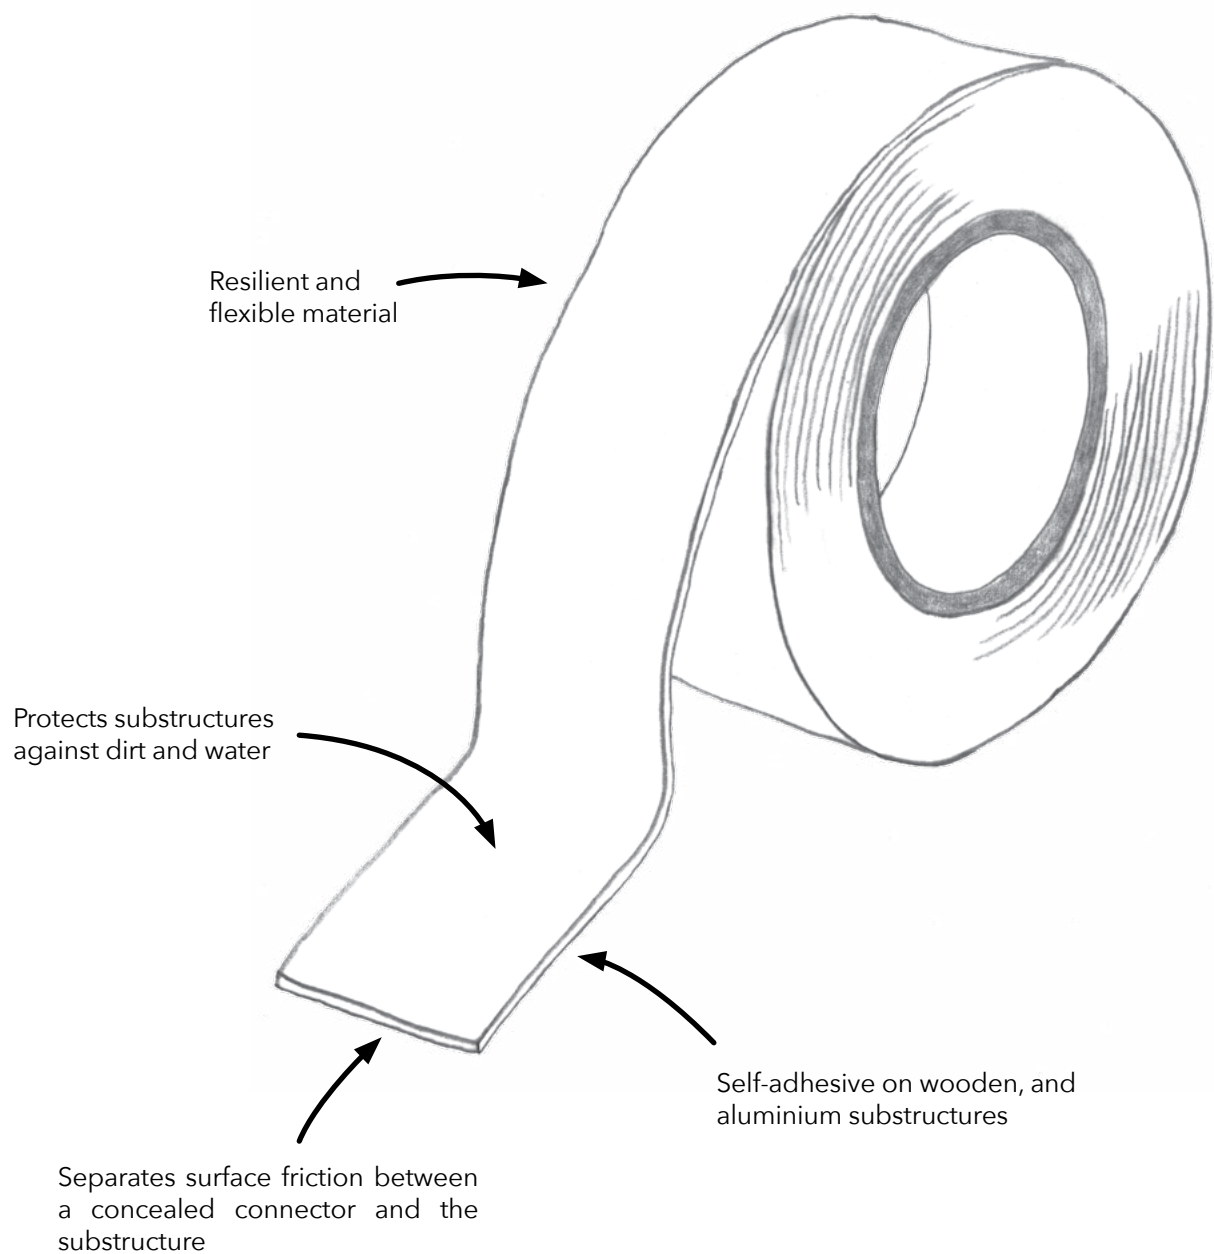

GUMO K acts as a separation layer between two surfaces (hidden fastening clip and substructure) prone to friction, for example DILA connected to RELO.

The rubber-like material is highly resistant and gives a perfect functionality in its application.

A simple and fast assembly process is achieved by the practical and handy roll with a length of 10 meters.

GUMO K HIGHLIGHTS

OVERVIEW

Length:	10 m Roll
Width:	75 mm
Thickness:	0,60 mm
Sticks on:	aluminum, wood, concrete, stainless steel
Special features:	elasticized
