BRANCHENINFORMATION

Lebensmittelhygienische Eigenschaften von ALKORCELL

Verarbeiter und Verbraucher fordern zunehmend Produkte, die den Richtlinien nach physiologischer Unbedenklichkeit gerecht werden. Nachdem ALKORCELL auch im Bereich Küchenmöbel Einsatz findet, haben wir die Prüfung auf lebensmittelhygienische Eigenschaften an der FMPA-Stuttgart durchführen lassen.

Das beiliegende Prüfzeugnis bestätigt für ALKORCELL neben der Geruchs- und Geschmacksfreiheit Eigenschaften, wie sie praktisch für Lebensmittelverpackungen toleriert werden.

Date: 25<sup>th</sup> of June 1985

You sent us samples from ALKOCRELLs range of overlays. Different types, colours and patterns and chemical make up. We were to test these overlays for reaction concerning hygiene of foodstuffs. It is not intended that the overlay be in constant contact with food, however short contact in the household is unavoidable. To attain a reliable estimation of the characteristics the test was made according to the advice of the Commission for Plastics of the Federal Health Authority (BGA) (III).

Besides the preliminary test to the above (according to the positive list of BGA) also the global or specified migration in wet, acid, alcoholic and fatty fluids as well as an organoleptic test of taste and odour in drink water were made.

The estimation of the separate results showed that the migration of the contents met the requirements tolerated for foodstuff packages. Nothing suggested a detrimental effect for taste or odour.

#### Summary

After having made the tests on the ALKORCRELL-overlay samples according to the advice of the Commission for Plastics of the Federal Health Authority (BGA) we noted no negative influence caused by the material when it is used conform to its usage and technical suitability on foodstuffs in a short contact.
